

IN THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

10. A portable telephone comprising a phototaking optical system, a two-dimensional image pickup element for receiving an object image formed by said phototaking optical system, a two-dimensional display element for displaying said object image in the form of an image to be viewed, and a magnifying optical system for guiding said image to a viewer's eyeball, wherein:

said magnifying optical system includes a first reflecting surface for turning back an optical path between said two-dimensional display element and said viewers eyeball to achieve compactness,

said first reflecting surface being formed by a curved surface having an image-magnifying action.

11. A portable telephone according to claim 10, wherein:

said magnifying optical system further includes a second reflecting surface located in opposition to said first reflecting surface to turn back an optical path between said first reflecting surface and said second reflecting surface, thereby making a distance between said two-dimensional display element and said viewer's eyeball short.

12. A portable telephone according to claim 11, wherein:

said first reflecting surface and said second reflecting surface are a prism member made up of a transparent medium having a refractive index (n) greater than 1.3 ( $N > 1.3$ ).

13. A portable telephone according to claim 12, wherein:

said first reflecting surface is formed on one surface of said prism member, and said second reflecting surface is located at a position where a medium of said prism member is sandwiched between said first reflecting surface and said second reflecting surface.

14. A portable telephone according to claim 12, wherein:  
said second reflecting surface is combined transmitting and reflecting surface.
15. A portable telephone according to claim 12, wherein:  
at least one of said first reflecting surface or said second reflecting surface is formed by a rotationally asymmetric surface having an action to make correction for aberrations produced by decentration.
16. A portable telephone according to claim 15, wherein:  
said two-dimensional image pickup element is located in opposition to said two-dimensional display element.
17. A portable telephone according to any one of claims 10 to 16, wherein:  
said magnifying optical system has two actions, one to guide an image displayed on said two-dimensional display element to said viewer's eyeball and the other to guide object light phototaken by said phototaking optical system directly to said viewer's eyeball.
18. A portable telephone according to any one of claims 10 to 16, which further comprises between said two-dimensional image pickup element and said two-dimensional image pickup element and said two-dimensional display element a signal processing circuit, a controller, a driver and a recording/reproducing unit so that an object image received at said two-dimensional image pickup element is recorded in said recording/reproducing unit upon photoelectric conversion and, at the same time, is displayed on said two-dimensional display element by said driver via said controller during phototaking, and, after phototaking, a signal recorded in said recording/reproducing unit is reproduced to display an electronic image on said two-dimensional display element by said driver via said controller.
